What the Hack: Conditionals | Episode 3 Challenges Solutions

Ready to test your knowledge? Take a look at some solutions to the challenges!

Challenge 1: Number comparison and decision making

In this challenge, we will make some decisions using what we learned today and some information from the user! We will ask the user for a number, and compare the number with the number 5 to decide and show whether this number is greater than, less than or equal to 5!

Write a program that asks the user a number between 1 and 10, and print out if the number is greater, less, or equal to 5.

Hint: You will need to compare the number that the user inputs to 5 using what we just learned today! Also, remember, when you take in an input, it is in a string. If needed, review the previous video if you need a refresher on how to convert variables into different types.
